

The Barcode System — Everything Explained

One simple guide. No computer knowledge needed.

What's inside:

1. What a barcode really is · 2. You teach each product once · 3. The same product is known forever · 4. Where the details come from · 5. Expiry dates & batches · 6. The 3 buttons · 7. What to do — every situation · 8. The honest truth · 9. Golden rules

1 What a barcode really is

A barcode (the black lines on a product) is just a **number**. That's all. It does **not** hold the name, price, or expiry. It is only an ID — like a phone number.

Think of your phone contacts. A phone number alone is just digits. You save it once with a name — "Ramesh" — and forever after, your phone shows "Ramesh" when he calls. Our system works the exact same way.

2 You teach each product ONCE

The first time the computer ever sees a product, it doesn't know it. You **teach it once** — link the barcode to the product name. Like saving a new contact. After that, it's remembered forever.

You teach **one time per product** — never per bottle, never per delivery. Teach it on day one, and you never teach that product again.

3 The same product is known forever

Every Diet Coke in the world has the **same barcode**. The 1st, the 2nd, the 1000th — identical. So once you teach the 1st one, every Diet Coke after that is recognised **instantly**.

1st Diet Coke → "don't know it" → you teach it once ✓
2nd Diet Coke → same barcode! → "Ah, Diet Coke" → done ✓
3rd, 4th, 100th → just scan → done ✓

You do NOT re-teach the same product. Same barcode = recognised automatically, like Ramesh calling again — the phone already knows him.

4 Where the details come from (name, price, unit)

The details live **inside the product**, not in the barcode. When the barcode is linked, scanning shows them — because they were already saved. And good news: your **523 products are already loaded with their details** (name, category, unit, price) from your store's stock file.

Detail	Where it comes from
Name (Diet Coke)	Already saved ✓
Category (Beverages)	Already saved ✓
Unit (bottle / pcs)	Already saved ✓
Price	Already saved ✓
How many came today	You type this 🖱️

The **only** thing you type is the **quantity** — because how many arrived is different every delivery. Everything else is already known.

5 Expiry dates & batches (the important one)

The expiry date is **printed separately** on the pack — it is **not** inside the small bottle barcode. So the barcode stays the same, but each delivery can have a different expiry. The system handles this with **batches**:

Diet Coke — 1st delivery: 20 bottles, expiry Dec 2026 → Batch #1

Diet Coke — 2nd delivery: 30 bottles, expiry Mar 2027 → Batch #2

▲ same barcode

▲ different expiry, kept separate

Each delivery becomes its own batch with its own expiry. When you sell, the system gives out the **oldest one first** (Batch #1) — so nothing expires sitting on the shelf. That's called **FIFO** (First In, First Out).

For loose bottles, you type the expiry **once per delivery** (same date for the whole lot). If goods come in a **wholesale carton with a long barcode**, that barcode holds the expiry inside — and it fills in **automatically**.

6 The 3 buttons

SETUP

Teach a product (once)

INWARD

Stock coming IN

OUTWARD

Stock going OUT

Pick a button, then scan. **Purple = teach**, **green = in**, **orange = out**.

7 What to do — every situation

A brand-new product arrives (first time)

- 1 Press green INWARD. Type how many. Scan.
- 2 It says "don't know it" → a list pops up.
- 3 Tap the product's name once. (If it has an expiry, type it.)
 Linked + stock added. You'll never pick from the list for this product again.

The same product arrives again (next time)

- 1 Press green INWARD. Type how many. Scan.
 Recognised instantly. No list. Done.

Goods leave the store

- 1 Press orange OUTWARD. Type how many. Scan.
 Stock removed (oldest batch first). Done.

8 The honest truth (what's automatic)

When you scan...	What it knows by itself
A product you've taught before	Everything — name, price, unit, stock 
A wholesale carton (long barcode)	Also batch + expiry + weight 
A big national brand (Amul, Coke...)	Found online & matched automatically 
A brand-new product, first time	You tap the name once → then automatic 

No system anywhere "reads details out of a barcode" — the barcode is only a number. Big stores like D-Mart teach each product once, then scan forever. **We do exactly the same.**

1. **Teach each product once** (purple SETUP) — only the first time it's ever seen.
2. **Goods coming in?** → green INWARD.
3. **Goods going out?** → orange OUTWARD.
4. **Always type the quantity first**, then scan.
5. **Click inside the scan box** so the scanner types there.
6. Same product = same barcode = **recognised forever**. You never re-teach it.

Teach each product ONCE → then just scan IN and scan OUT. 📦
The computer remembers everything. You only ever type the quantity.
