

The Barcode System

A super-simple guide. If you can use a phone, you can use this.

First, what is a barcode?

A barcode is just those **black lines** printed on every product. When you scan it, the computer reads a **number** — that's all it is. A number. Nothing else. It does **not** contain the product's name or price.

Think of it exactly like your phone contacts.

A phone number by itself is just digits. But you **save it once** with a name — "Ramesh" — and after that, every time Ramesh calls, your phone shows "**Ramesh**", not the number.

Our system is the same: we **teach it once** — "this barcode = this product" — and after that, every scan shows the product automatically.

There are only 3 buttons

Open the app, go to the **Scan** page. You will see three big buttons at the top:

SETUP

Teach the computer (do this once)

INWARD

Stock coming IN

OUTWARD

Stock going OUT

That's it. Pick a button, then scan. The colour tells you what you're doing: **purple = teach**, **green = in**, **orange = out**.

Button 1 — SETUP (teach the computer)

You do this ONCE for each product. Like saving a contact in your phone.

1

Click the purple SETUP button.

2

Scan a product's barcode.

The computer says: "I don't know this one yet."

3

A list of your products appears. Tap the right one.

Type a few letters of the name to find it fast. Tap it.

4

Done! That barcode is now saved forever. ✓

Scan the next product. Keep going down your shelves.

You never have to do this again for that product.

Button 2 — INWARD (stock coming in)

Use this when **new goods arrive** in the shop.

1

Click the green INWARD button.

2

Type how many (the Quantity box). Example: 10.

3

Scan the product.

Stock goes UP by 10. The screen shows it. Done.

WHAT YOU SEE ON SCREEN

scan here...

+10 "now 35 in stock"

Button 3 — OUTWARD (stock going out)

Use this when goods **leave** the shop (sold, used, dispatched).

1 Click the orange **OUTWARD** button.

2 Type how many. Example: 4.

3 Scan the product.

Stock goes DOWN by 4. The computer automatically takes the oldest stock first, so nothing gets too old.

WHAT YOU SEE ON SCREEN

 scan here...

 **-4 "now 31 in stock"**

A normal day in the shop

Morning: a delivery arrives.

Press **INWARD**, type the count, scan each item. Stock goes up.

During the day: goods go out.

Press **OUTWARD**, type the count, scan. Stock goes down.

Anytime: the boss checks reports.

Stock levels, low-stock warnings, expiry alerts — all update by themselves.

What if it says "I don't know this barcode"?

No problem — it just means that product was never taught yet. A small box appears: **pick the right product from the list, tap it**, and it's saved. Next time, it will be recognised instantly. It's the same as saving a new contact in your phone.

The only rules to remember

1. **First, teach each product once** using the purple SETUP button.
2. **Goods coming in?** → Green INWARD button.
3. **Goods going out?** → Orange OUTWARD button.
4. **Always type the quantity first**, then scan.
5. **Click inside the scan box** so the scanner knows where to type.

That's the whole system. Teach once → then just scan in and scan out. 🎉
